

Yoga Geek information flow

Information Architecture

I want to use tab bars. The first one is for exploring yoga poses, the second one is for setting up a sequence. The last one is called "Community". User can see other people's sequences or share their created sequences.

For yoga poses exploration, each yoga pose is represented by a small icon which is represented by my pose pictures and its name stored at backend database. User can scroll down to see more or search. Provide user with the filter options by muscleGroup, difficulty level. When they click on one of them, it directs them to a new page showing name, benefits etc. details and give them the option to add to a new or existing sequence.

For the tab of Sequence, user can see their existing sequences and can add a new sequence from there by showing them a "Add new" button. Once they click "Add new", prompt user with 3 options.

- The first option is to have the app guide user to create the sequence
 - Prompt user where they want to begin with, two choices, either "Muscle Group" or "Peak Poses".
 - If they choose "Muscle Group", list all available muscleGroups from yoga poses under Exploration.
 - If they choose "Peak Poses", list all available poses that are advanced
 - Always display to user that they can go back to all poses. Once they are done with the initial selection by selecting one or more poses, you can start to prompt user how long the class is and provide a few options: 15min, 30min, 45min, 60min and 75min.
 - Prompt user with one section at a time. For now, for all time options, each has the same 4 sections: beginning, flow1, flow2 and ending. Tell user that you have put peak pose at flow2 section and they can adjust it anytime.
 - Prompt user which section they want to work on. Once they select a section, begin to recommend relevant poses to user. For now, just pop up random choices to user. Give a button to user that they can go to the next section when it's done.
- The second option is to have user self-create all sections. they are directed into another page where it shows them the module to add section, name it, and add poses into section. Move all your existing design to this option when user selects it.
- The third option is to enable user to copy their sections from existing sequences to new one.
